Rondônia if detaches in the national media on the case of Cacoal

As if it was not enough to the senders of television, periodicals and web periodicals of the State, now all Brazil is cliente of the fact occurred in the city of Cacoal.

The news propagated in the State of Rondônia already has at least one week, now turns national prominence on the case occurred in the interior the city Cacoal, center-east of the State, where, supposedly, one “objeto” not-identified it would have fallen in a property in the agricultural zone causing direct impact in the ground.

According to witnesses, in the hour where the phenomenon occurred, rain falls with much intensity in the region, what it could be evidenced by the images of satellite with the date and hour where the event changed the routine of the cacoalense.

In the last days, much has been commented on the subject. The information, in the majority of the cases contradictory, took much people to think that not-identified flying objects, calls OVNIS and UFOS would have given one passadinha for Cacoal and left its marks. Others accuse to have seen parts metallic, as were disintegrated branches of satellite, or fragmentos even though rocky of meteorites that would have touched the ground.

In NONE of these hypotheses it has confirmation of the fact, as much that, an object to fall of the sky the so great speed and to provoke surprising cracks in the ground, some resqunçio has to have as fragmented part of the supposed collision.

However, after some people to have visited the property, that is in the known mount of the Embratel, for being located next to a tower to the telephonic company, does not have nothing, none I accuse that really it proves the one fall “objeto” or more necessarily, of fragmented parts of a meteorite.

For the as many cases that they occur Brazil it measures, the researchers of the INPE (National Institute of Space Research) of They are Jose of the Fields-SP, they stand out that always they appear indicative of atypical phenomena or mere humbugs, simply to display one definitive region to the media in general, what it seems not to be the case of Cacoal.

In the locality some does not have object, rocky, metallic part, tracks or dust of compacting, odor or different coloration of the ground. What it only exists they are some meters of fallen trees and part of an abrupt declivity cracked for the so great force of the impact.

The information of that technician of the INPE would be come the Rondônia to analyze the case was contradicted today per the morning, through carried through contact way email and phone call. The proper researchers of the Institution who all make the monitoramento of the terrestrial atmosphere advise that something deeper and investigativo is made in the region only for ufylogos, professionals enabled in studies of paranormais phenomena.

Searching in our archives, this is not the first one, nor the most severe registered case already in Rondônia.

In the passed year, more necessarily in day 23 of March, one another luminous object observed falling of the sky as a great fire torch, was also registered in a property in the agricultural zone of the Black Mount city, center-north of the State, distant about 248 km of the Porto Velho capital.

In the occasion, the estragos had been wide bigger, with the register of 64 heads of cattle deceased instantaneamente after the sudden fall of a type of very rare electric discharge, the call “raio-bola”.

Image of the cattle died in Black Mount after the one fall “raio-bola” in the region center-north of Rondônia.

With passing of some months, one another event reached the interior of Rondônia, of this time in the agricultural zone of the city of Valley of the Paradise, located in the center-east of the State, region of Ji-Paraná, distant about 336 km of Porto Velho. In this in case that she were registered the death of more 18 heads of cattle reached by one strong electric discharge, of which presented the same characteristics observes in Cacoal, with enormous cracks in the soil and a vast number of trees dilaceradas for the force of the impact.

In this case occurred in Valley of the Paradise had been to all the 18 heads of cattle also deceased instantaneamente reached by a type of rare electric discharge.

Still in the year passed, during an intense storm of rays in the city of Ji-Paran6, occurred in the night of day 21 of October, one another register of "raio-bola", thus supposedly declared for the population it was seen crossing the sky as a great fire ball. The result proven in the posterior day to the event was of a great crack and substantial survey of the ground in a distant property about 60 kilometers of the city, next to the Hill district New, already in the verge with the Been neighbor of Mato Grosso. In this event, the force of the electric discharge was so great, that holes wide were opened in way to the rocks, as they had been stoned the hard axes blow.

The image indicates the force of the electric discharge when casting a rock in a property of Ji-Paran6.

The rays in ball form can produce effect very surprising. Although to be still unknown a luminous discharge, a theory affirms that the phenomenon consists where a plasma circular if unfastens of a cloud, it arrives until the soil and if it vanishes in its course. It possesss a certain stability, lasting some seconds and, extraordinariamente, until some minutes. It has a size of few centimeters, but, with exceptions, of the order of until a meter. Although if it forms in storm time, in other occasions it can happen with good time. A color very repeated is the red-orange. Its speed already arrived to be of up to 100 km/h and its dynamics is indifferent to the direction of the wind or the gravity. It produces similar sounds the hummings, unfastening similar odor to sulphur or ozone. This phenomenon intervenes with the radio emissions, leaves marks of burnings and other tracks in the soil and already affected the man with paralysis, adormecimento and burnings. However, it is not a common phenomenon.

As much the cases observed in the last months, how much most recent of Cacoal, leads for the certification of the people who turn the events, as of the impacts suffered after the collision, of plus an episode of “raio-bola” in Rondônia.

Still it does not have nothing proven much less, the scientists had arrived at the region to give the final conclusion. In accordance with the researchers of the area, in contact saw telephone carried through in the afternoon of this Saturday, for the photos and repassed images of videos, are about pparently plus a case of registered rare electric discharge in Rondônia, what it must foment in deeper studies on the event in the region.
